# A NOTE ON QUANTIFIER ELIMINATION IN SHELAH-SPENCER GRAPHS

#### ANTON BOBKOV

ABSTRACT. We simplify [?]'s proof of quantifier elimination in Shelah-Spencer graphs.

### 1. Introduction

Laskowski's paper [?] provides a combinatorial proof of quantifier elimination in Shelah-Spencer graphs. Here we provide a simplification of the proof using only maximal chains and avoiding the use of proposition 3.1 and technical lemmas of section 4.

We will use notation of [?], in particular things like  $K_{\alpha}$ ,  $\delta(\mathcal{A}/\mathcal{B})$ ,  $X_m(\mathcal{A})$ ,  $S_{\alpha}$ ,  $\mathcal{B}^* \sqsubseteq \mathcal{B}'$ ,maximal embedding,  $\Delta_{\mathcal{A}}(x)$ ,  $\Psi_{\mathcal{A},\mathcal{B}}(x)$  etc. However we will give a different definition of  $Y(\ldots)$ . When we write formulas  $\theta(x,y)$  we may have x,y to be tuples.

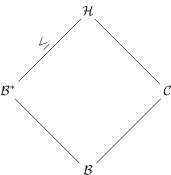

### 2. Omitting Lemma

**Definition 2.1.** Let  $\mathcal{M} \models S_{\alpha}$ ,  $\mathcal{B} \in \mathbf{K}_{\alpha}$ , embedding  $f : \mathcal{B} \to \mathcal{M}$ ,  $\Phi$  finite subset of  $\mathbf{K}_{\alpha}$ 

- (1) Say that f omits  $\Phi$  if there are no  $\mathcal{C} \in \Phi$  and  $g: \mathcal{C} \to \mathcal{M}$  extending f.
- (2) Say that f admits  $\Phi$  if for every  $\mathcal{C} \in \Phi$  there is  $g: \mathcal{C} \to \mathcal{M}$  extending f.

Note 2.2. Take notation as above and a structure  $C \in K_{\alpha}$  extending  $\mathcal{B}$ . Then f doesn't omit  $\{C\}$  iff f admits  $\{C\}$ .

**Definition 2.3.** Fix  $\mathcal{B}, \mathcal{C} \in K_{\alpha}$ , and  $m \in \omega$  such that  $|C \setminus B| < m$ . Define  $Z(\mathcal{B}, \mathcal{C}, m)$  to be all  $\mathcal{B}^* \in X_m(\mathcal{B})$  such that there are no  $\mathcal{H}$  with  $|H \setminus B^*| < m$  satisfying

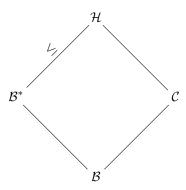

**Lemma 2.4.** Let  $\mathcal{B}, \mathcal{C} \in K_{\alpha}$ , and  $m \in \omega$  such that  $|C \setminus B| < m$ . Also let  $\mathcal{M} \models S_{\alpha}$  and  $f : \mathcal{B} \to \mathcal{M}$  an embedding. The following are equivalent:

(1) f omits  $\{C\}$ .

(2) There exists  $\mathcal{B}^* \in Z(\mathcal{B}, \mathcal{C}, m)$  maximally embeddable into  $\mathcal{M}$  over f.

*Proof.* For the proof we identify  $\mathcal{B}$  with  $f(\mathcal{B})$ , i.e. for ease of notation assume that  $\mathcal{B} \subset \mathcal{M}$ .

 $(1) \Rightarrow (2)$  By remark 5.3 of [?] there is some  $B^* \in X_m(\mathcal{B})$  maximally embeddable in  $\mathcal{M}$  over f. Such embedding is unique by Lemma 3.8 of [?]. Again, we identify  $B^*$  with its maximal embedding into  $\mathcal{M}$ . To show (2) we need to verify that  $\mathcal{B}^* \in Z(\mathcal{B}, \mathcal{C}, m)$ . Suppose not. Then there is  $\mathcal{H}$  with  $|H \setminus B^*| < m$  satisfying

As  $\mathcal{B}^* \leq \mathcal{H}$  and  $\mathcal{B} \subset \mathcal{M}$  we can embed  $\mathcal{H}$  into  $\mathcal{M}$  (as  $\mathcal{M} \models S_{\alpha}$ ). But this would witness  $\mathcal{C}$  extending  $\mathcal{B}$  in  $\mathcal{M}$  which is impossible as we assumed that f omits  $\{\Phi\}$ .

 $(2) \Rightarrow (1)$  Suppose f doesn't omit  $\{C\}$ . Then by the note  $\ref{thm:property}$  f admits  $\{C\}$ , i.e. there is an embedding of  $\mathcal{C}$  into M over f. We identify  $\mathcal{C}$  with the image of that embedding. Similarly we identify  $\mathcal{B}^*$  with the image of its maximal embedding over f. That is we may assume  $\mathcal{C}, \mathcal{B}^* \subset \mathcal{M}$ . Let H be the substructure of M induced by vertices  $C \cup B^*$ . As  $|C \setminus B| < m$  we have  $|H \setminus B^*| < m$ .  $\mathcal{B}^*$  is m-strong by remark 5.3 of  $[\ref{thm:property}]$ . This forces  $\mathcal{B}^* < H$ . But this contradicts the fact that  $\mathcal{B}^* \in Z(\mathcal{B}, \mathcal{C}, m)$ .  $\square$ 

**Corollary 2.5.** With the setup of the previous lemma, the following are equivalent:

- (1) f admits  $\{C\}$ .
- (2) There exists  $\mathcal{B}^* \in X_m(\mathcal{B}) \setminus Z(\mathcal{B}, \mathcal{C}, m)$  maximally embeddable into  $\mathcal{M}$  over f.

For quantifier elimination we need to track multiple structures being admitted and omitted, hence the following definition.

**Definition 2.6.** Let  $\mathcal{B} \in K_{\alpha}$ ,  $\Phi, \Gamma$  finite subsets of  $K_{\alpha}$ , and  $m \in \omega$  such that for each  $\mathcal{C} \in \Phi$  or  $\mathcal{C} \in \Gamma$  we have  $\mathcal{B} \subseteq \mathcal{C}$  and  $|\mathcal{C} \setminus \mathcal{B}| < m$ . Define

$$Y(\mathcal{B}, \Phi, \Gamma, m) = \{B^* \in X_m(\mathcal{B}) \mid \forall \mathcal{C} \in \Phi \ B^* \in Z(\mathcal{B}, \mathcal{C}, m) \text{ and } \\ \forall \mathcal{D} \in \Gamma \ B^* \notin Z(\mathcal{B}, \mathcal{D}, m)\}$$

**Lemma 2.7.** Let  $\mathcal{B} \in K_{\alpha}$ ,  $\Phi, \Gamma$  finite subsets of  $K_{\alpha}$ , and  $m \in \omega$  such that for each  $\mathcal{C} \in \Phi$  or  $\mathcal{C} \in \Gamma$  we have  $\mathcal{B} \subseteq \mathcal{C}$  and  $|\mathcal{C} \setminus \mathcal{B}| < m$ . The following are equivalent:

- (1) f omits  $\Phi$  and admits  $\Gamma$ .
- (2) There exists  $\mathcal{B}^* \in Y(\mathcal{B}, \Phi, \Gamma, m)$  maximally embeddable into  $\mathcal{M}$  over f.

*Proof.* Easy corollary of ?? and ??.

## 3. Quantifier Elimination

Following proof of 5.6 in [?], we have a formula  $\theta(x,y)$ , some  $\mathcal{A} \subseteq \mathcal{B} \in \mathbf{K}_{\alpha}$  with  $\theta(x,y) \vdash \Delta_A(x) \land \Delta_{\mathcal{B}}(x,y)$ . We may also assume that  $\theta(x,y)$  is a conjunction of formulas of the type  $\Psi_{\mathcal{B},\mathcal{C}}(x,y)$  and their negations. More precisely

$$\theta(x,y) \Leftrightarrow \bigwedge_{\mathcal{C} \in \Phi} \Psi_{\mathcal{B},\mathcal{C}}(x,y) \wedge \\ \bigwedge_{\mathcal{D} \in \Gamma} \neg \Psi_{\mathcal{B},\mathcal{D}}(x,y)$$

for some finite subsets  $\Phi, \Gamma$  of  $\mathbf{K}_{\alpha}$ . Let  $m = \max\{|C \setminus B| \mid C \in \Phi \text{ or } \Gamma\}$ . We claim that in  $\mathcal{M} \models S_{\alpha}$ 

$$\exists y \theta(x,y) \Leftrightarrow \bigvee_{\mathcal{B}^* \in Y(\mathcal{B},\Phi,\Gamma,m)} (\mathcal{B}^* \text{ maximally embeds into } \mathcal{M} \text{ over } \mathcal{A})$$

$$\Leftrightarrow \bigvee_{\mathcal{B}^* \in Y(\mathcal{B},\Phi,\Gamma,m)} \left( \Psi_{\mathcal{A},\mathcal{B}^*}(x) \land \bigwedge_{\mathcal{B}^* \sqsubseteq B',B' \in X_m(\mathcal{B})} \neg \Psi_{\mathcal{A},\mathcal{B}'}(x) \right)$$

*Proof.* ( $\Rightarrow$ ) Fix  $\mathcal{B} \subset \mathcal{M}$  witnessing existential statement. By remark 5.3 and lemma 3.8 There is a unique  $\mathcal{B}^* \in X_m$  (uniquely embedded) maximally embeddable into  $\mathcal{M}$  over  $\mathcal{B}$ . By lemma ??  $\mathcal{B}^* \in Y(\mathcal{B}, \Phi, \Gamma, m)$ .

( $\Leftarrow$ ) Take the embedding  $g: B^* \to \mathcal{M}$  and restrict it to  $\mathcal{B} \subseteq \mathcal{B}^*$  i.e.  $f = g \mid \mathcal{B}$ . As  $\mathcal{B}^* \in Y(\mathcal{B}, \Phi, \Gamma, m)$  by lemma ?? f omits  $\Phi$  and admits  $\Gamma$ . Thus is a witness to  $\exists y \theta(x, y)$ .
