# SOME VC-DENSITY COMPUTATIONS IN SHELAH-SPENCER GRAPHS

### ANTON BOBKOV

ABSTRACT. We investigate vc-density in Shelah-Spencer graphs. We provide an upper bound on formula-by-formula basis and show that there isn't a uniform lower bound forcing the vc-function to be infinite.

VC-density was studied in [1] by Aschenbrenner, Dolich, Haskell, MacPherson, and Starchenko as a natural notion of dimension for NIP theories. In a complete NIP theory T we can define the vc-function

$$vc^T = vc : \mathbb{N} \longrightarrow \mathbb{R} \cup \{\infty\}$$

where vc(n) measures the worst-case complexity of families of definable sets in an n-fold Cartesian power of the underlying set of a model of T (see 1.13 below for a precise definition of  $vc^T$ ). The simplest possible behavior is vc(n) = n for all n. Theories with the property that vc(1) = 1 are known to be dp-minimal, i.e., having the smallest possible dp-rank. It is not known whether there can be a dp-minimal theory which doesn't satisfy vc(n) = n (see [1], diagram on pg. 41).

In this paper, we investigate vc-density of definable sets in Shelah-Spencer graphs. In our description of Shelah-Spencer graphs we follow closely the treatment in [2]. A Shelah-Spencer graph is a limit of random structures  $G(n, n^{-\alpha})$  for an irrational  $\alpha \in (0, 1)$ .  $G(n, n^{-\alpha})$  is a random graph on n vertices with edge probability  $n^{-\alpha}$ .

Our first result is that in Shelah-Spencer graphs

$$vc(n) = \infty$$

which implies that they are not dp-minimal. Our second result is providing an upper bound on a vc-density for a formula  $\phi$ 

$$\operatorname{vc}(\phi) \le K(\phi) \frac{Y(\phi)}{\epsilon(\phi)}$$

where  $K(\phi), Y(\phi), \epsilon(\phi)$  are paramters easily computable from the quantifier free form of  $\phi$ .

Chapter 1 introduces basic facts about VC-dimension and vc-density. More can be found in [1]. Chapter 2 summarizes notation and basic facts concerning Shelah-Spencer graphs. We direct the reader to [2] for a more in-depth treatment. In chapter 3 we introduce some measure of dimension for quantifier free formulas as well as proving some elementary facts about it. Chapter 4 computes a lower bound for vc-density to demonstrate that  $vc(n) = \infty$ . Chapter 5 computes an upper bound for vc-density on a formula-by-formula basis.

# 1. VC-dimension and vc-density

Throughout this section we work with a collection  $\mathcal{F}$  of subsets of an infinite set X. We call the pair  $(X, \mathcal{F})$  a <u>set system</u>.

## Definition 1.1.

- Given a subset A of X, we define the set system  $(A, A \cap \mathcal{F})$  where  $A \cap \mathcal{F} = \{A \cap F \mid F \in \mathcal{F}\}.$
- For  $A \subseteq X$  we say that  $\mathcal{F}$  shatters A if  $A \cap \mathcal{F} = \mathcal{P}(A)$  (the power set of A).

**Definition 1.2.** We say  $(X, \mathcal{F})$  has <u>VC-dimension</u> n if the largest subset of X shattered by  $\mathcal{F}$  is of size n. If  $\mathcal{F}$  shatters arbitrarily large subsets of X, we say that  $(X, \mathcal{F})$  has infinite VC-dimension. We denote the VC-dimension of  $(X, \mathcal{F})$  by  $VC(X, \mathcal{F})$ .

**Note 1.3.** We may drop X from the notation  $VC(X, \mathcal{F})$ , as the VC-dimension doesn't depend on the base set and is determined by  $(\bigcup \mathcal{F}, \mathcal{F})$ .

Set systems of finite VC-dimension tend to have good combinatorial properties, and we consider set systems with infinite VC-dimension to be poorly behaved.

Another natural combinatorial notion is that of the dual system of a set system:

**Definition 1.4.** For  $a \in X$  define  $X_a = \{F \in \mathcal{F} \mid a \in F\}$ . Let  $\mathcal{F}^* = \{X_a \mid a \in X\}$ . We call  $(\mathcal{F}, \mathcal{F}^*)$  the <u>dual system</u> of  $(X, \mathcal{F})$ . The VC-dimension of the dual system of  $(X, \mathcal{F})$  is referred to as the <u>dual VC-dimension</u> of  $(X, \mathcal{F})$  and denoted by VC\* $(\mathcal{F})$ . (As before, this notion doesn't depend on X.)

**Lemma 1.5** (see 2.13b in [3]). A set system  $(X, \mathcal{F})$  has finite VC-dimension if and only if its dual system has finite VC-dimension. More precisely

$$VC^*(\mathcal{F}) \le 2^{1+VC(\mathcal{F})}$$
.

For a more refined notion of complexity of  $(X, \mathcal{F})$  we look at the traces of our family on finite sets:

**Definition 1.6.** Define the <u>shatter function</u>  $\pi_{\mathcal{F}} \colon \mathbb{N} \longrightarrow \mathbb{N}$  of  $\mathcal{F}$  and the <u>dual shatter function</u>  $\pi_{\mathcal{F}}^* \colon \mathbb{N} \longrightarrow \mathbb{N}$  of  $\mathcal{F}$  by

$$\pi_{\mathcal{F}}(n) = \max\{|A \cap \mathcal{F}| \mid A \subseteq X \text{ and } |A| = n\}$$
  
$$\pi_{\mathcal{F}}^*(n) = \max\{\text{atoms}(B) \mid B \subseteq \mathcal{F}, |B| = n\}$$

where atoms(B) = number of atoms in the boolean algebra of sets generated by B. Note that the dual shatter function is precisely the shatter function of the dual system:  $\pi_{\mathcal{F}}^* = \pi_{\mathcal{F}^*}$ .

A simple upper bound is  $\pi_{\mathcal{F}}(n) \leq 2^n$  (same for the dual). If the VC-dimension of  $\mathcal{F}$  is infinite then clearly  $\pi_{\mathcal{F}}(n) = 2^n$  for all n. Conversely we have the following remarkable fact:

**Theorem 1.7** (Sauer-Shelah '72, see [5], [6]). If the set system  $(X, \mathcal{F})$  has finite VC-dimension d then  $\pi_{\mathcal{F}}(n) \leq \binom{n}{\leq d}$  for all n, where  $\binom{n}{\leq d} = \binom{n}{d} + \binom{n}{d-1} + \ldots + \binom{n}{1}$ .

Thus the systems with a finite VC-dimension are precisely the systems where the shatter function grows polynomially. The vc-density of  $\mathcal{F}$  quantifies the growth of the shatter function of  $\mathcal{F}$ :

**Definition 1.8.** Define the vc-density and dual vc-density of  $\mathcal{F}$  as

$$\operatorname{vc}(\mathcal{F}) = \limsup_{n \to \infty} \frac{\log \pi_{\mathcal{F}}(n)}{\log n} \in \mathbb{R}^{\geq 0} \cup \{+\infty\},$$
$$\operatorname{vc}^*(\mathcal{F}) = \limsup_{n \to \infty} \frac{\log \pi_{\mathcal{F}}^*(n)}{\log n} \in \mathbb{R}^{\geq 0} \cup \{+\infty\}.$$

Generally speaking a shatter function that is bounded by a polynomial doesn't itself have to be a polynomial. Proposition 4.12 in [1] gives an example of a shatter function that grows like  $n \log n$  (so it has vc-density 1).

So far the notions that we have defined are purely combinatorial. We now adapt VC-dimension and vc-density to the model theoretic context.

**Definition 1.9.** Work in a first-order structure M. Fix a finite collection of formulas  $\Phi(x,y)$  in the language  $\mathcal{L}(M)$  of M.

• For  $\phi(x,y) \in \mathcal{L}(M)$  and  $b \in M^{|y|}$  let

$$\phi(M^{|x|}, b) = \{ a \in M^{|x|} \mid \phi(a, b) \} \subseteq M^{|x|}.$$

- Let  $\Phi(M^{|x|}, M^{|y|}) = \{\phi(M^{|x|}, b) \mid \phi_i \in \Phi, b \in M^{|y|}\} \subseteq \mathcal{P}(M^{|x|}).$
- Let  $\mathcal{F}_{\Phi} = \Phi(M^{|x|}, M^{|y|})$ , giving rise to a set system  $(M^{|x|}, \mathcal{F}_{\Phi})$ .
- Define the VC-dimension VC( $\Phi$ ) of  $\Phi$  to be the VC-dimension of  $(M^{|x|}, \mathcal{F}_{\Phi})$ , similarly for the dual.
- Define the <u>vc-density</u>  $vc(\Phi)$  of  $\Phi$  to be the vc-density of  $(M^{|x|}, \mathcal{F}_{\Phi})$ , similarly for the dual.

We will also refer to the vc-density and VC-dimension of a single formula  $\phi$  viewing it as a one element collection  $\Phi = {\phi}$ .

Counting atoms of a boolean algebra in a model theoretic setting corresponds to counting types, so it is instructive to rewrite the shatter function in terms of types.

## Definition 1.10.

$$\pi_{\Phi}^*(n) = \max \{ \text{number of } \Phi \text{-types over } B \mid B \subseteq M, |B| = n \} .$$

Here a  $\Phi$ -type over B is a maximal consistent collection of formulas of the form  $\phi(x,b)$  or  $\neg \phi(x,b)$  where  $\phi \in \Phi$  and  $b \in B$ .

The functions  $\pi_{\Phi}^*$  and  $\pi_{\mathcal{F}_{\Phi}}^*$  do not have to agree, as one fixes the number of generators of a boolean algebra of sets and the other fixes the size of the parameter set. However, as the following lemma demonstrates, they both give the same asymptotic definition of dual vc-density.

### Lemma 1.11.

$$\operatorname{vc}^*(\Phi) = degree \ of \ polynomial \ growth \ of \ \pi_{\Phi}^*(n) = \limsup_{n \to \infty} \frac{\log \pi_{\Phi}^*(n)}{\log n}.$$

*Proof.* With a parameter set B of size n, we get at most  $|\Phi|n$  sets  $\phi(M^{|x|}, b)$  with  $\phi \in \Phi, b \in B$ . We check that asymptotically it doesn't matter whether we look at growth of boolean algebra of sets generated by n or by  $|\Phi|n$  many sets. We have:

$$\pi_{\mathcal{F}_{\Phi}}^{*}(n) \leq \pi_{\Phi}^{*}(n) \leq \pi_{\mathcal{F}_{\Phi}}^{*}(|\Phi|n)$$
.

Hence:

$$\begin{aligned} &\operatorname{vc}^*(\Phi) \leq \limsup_{n \to \infty} \frac{\log \pi_{\Phi}^*(n)}{\log n} \leq \limsup_{n \to \infty} \frac{\log \pi_{\mathcal{F}_{\Phi}}^*\left(|\Phi|n\right)}{\log n} = \\ &= \limsup_{n \to \infty} \frac{\log \pi_{\mathcal{F}_{\Phi}}^*\left(|\Phi|n\right)}{\log |\Phi|n} \frac{\log |\Phi|n}{\log n} = \limsup_{n \to \infty} \frac{\log \pi_{\mathcal{F}_{\Phi}}^*\left(|\Phi|n\right)}{\log |\Phi|n} \leq \\ &\leq \limsup_{n \to \infty} \frac{\log \pi_{\mathcal{F}_{\Phi}}^*\left(n\right)}{\log n} = \operatorname{vc}^*(\Phi). \end{aligned}$$

One can check that the shatter function and hence VC-dimension and vc-density of a formula are elementary notions, so they only depend on the first-order theory of the structure M.

NIP theories are a natural context for studying vc-density. In fact we can take the following as the definition of NIP:

**Definition 1.12.** Define  $\phi$  to be NIP if it has finite VC-dimension in a theory T. A theory T is NIP if all the formulas in T are NIP.

In a general combinatorial context (for arbitrary set systems), vc-density can be any real number in  $0 \cup [1, \infty)$  (see [4]). Less is known if we restrict our attention to NIP theories. Proposition 4.6 in [1] gives examples of formulas that have non-integer rational vc-density in an NIP theory, however it is open whether one can get an irrational vc-density in this model-theoretic setting.

Instead of working with a theory formula by formula, we can look for a uniform bound for all formulas:

**Definition 1.13.** For a given NIP structure M, define the <u>vc-function</u>

$$\operatorname{vc}^{M}(n) = \sup \{ \operatorname{vc}^{*}(\phi(x, y)) \mid \phi \in \mathcal{L}(M), |x| = n \}$$
$$= \sup \{ \operatorname{vc}(\phi(x, y)) \mid \phi \in \mathcal{L}(M), |y| = n \} \in \mathbb{R}^{\geq 0} \cup \{ +\infty \}.$$

As before this definition is elementary, so it only depends on the theory of M. We omit the superscript M if it is understood from the context. One can easily check the following bounds:

**Lemma 1.14** (Lemma 3.22 in [1]). We have 
$$vc(1) \ge 1$$
 and  $vc(n) \ge n vc(1)$ .

However, it is not known whether the second inequality can be strict or even whether  $vc(1) < \infty$  implies  $vc(n) < \infty$ .

## 2. Graph Combinatorics

Throughout this paper A, B, C, M will denote finite graphs, and  $\mathbb{D}$  will be used to denote potentially infinite graphs. For a graph A the set of its vertices is denoted by v(A), and the set of its edges by e(A). Number of vertices of A will be denoted as |A|. Subgraph always means induced subgraph and  $A \subseteq B$  means that A is a

subgraph of B. For two subgraphs A,B of a larger graph, the union  $A \cup B$  denotes the graph induced by  $v(A) \cup v(B)$ . Similarly, A - B means a subgraph of A induced by the vertices of v(A) - v(B). For  $A \subseteq B \subseteq D$  and  $A \subseteq C \subseteq D$ , graphs B,C are said to be disjoint over A if v(B) - v(A) is disjoint from v(C) - v(A) and there are no edges from v(B) - v(A) to v(C) - v(A) in D.

For the remainder of the paper fix  $\alpha \in (0,1)$ , irrational.

### Definition 2.1.

- For a graph A let  $\dim(A) = |A| \alpha |e(A)|$ .
- For A, B with  $A \subseteq B$  define  $\dim(B/A) = \dim(B) \dim(A)$ .
- We say that  $A \leq B$  if  $A \subseteq B$  and  $\dim(A'/A) > 0$  for all  $A \subsetneq A' \subseteq B$ .
- Define A to be positive if for all  $A' \subseteq A$  we have  $\dim(A') \ge 0$ .
- We work in theory  $S_{\alpha}$  in the language of graphs axiomatized by:
  - Every finite substructure is positive.
  - Given a model  $\mathbb{G}$  and graphs  $A \leq B$ , every embedding  $f: A \longrightarrow \mathbb{G}$  extends to an embedding  $g: B \longrightarrow \mathbb{G}$ .

(Here an embedding maps edges to edges and nonedges to nonedges.) This theory is complete and stable (see 5.7 and 7.1 in [2]). From now on fix an ambient model  $\mathbb{G} \models S_{\alpha}$ . This will be the only infinite graph we work with.

- For A, B positive, (A, B) is called a minimal pair if  $A \subseteq B$ ,  $\dim(B/A) < 0$  but  $\dim(A'/A) \ge 0$  for all proper  $A \subseteq A' \subsetneq B$ . We call B a minimal extension of A. The dimension of a minimal pair is defined as  $|\dim(B/A)|$ .
- A sequence  $\langle M_i \rangle_{0 \le i \le n}$  is called a <u>minimal chain</u> if  $(M_i, M_{i+1})$  is a minimal pair for all  $0 \le i < n$ .
- For a graph A with the tuple of vertices x let  $\operatorname{diag}_A(x)$  be the atomic diagram of A, i.e. the first-order formula recording whether there is an edge between every pair of vertices.
- Given  $A \subseteq B$  let

$$\phi_{A,B}(x) = \operatorname{diag}_A(x) \wedge \exists z \operatorname{diag}_B(x,z).$$

Any graph isomorphic to B is called a <u>witness</u> of  $\phi_{A,B}$ .

• A formula  $\phi_{A,B}$  is called a <u>basic formula</u> if there is a minimal chain  $\langle M_i \rangle_{0 \le i \le n}$  such that  $A = M_0$  and  $B = M_n$ .

**Theorem 2.2** (Quantifier elimination, 5.6 in [2]). In theory  $S_{\alpha}$  every formula is equivalent to a boolean combination of basic formulas.

**Definition 2.3.** A graph  $S \subseteq \mathbb{D}$  is called <u>N</u>-strong if for any  $S \subseteq T \subseteq D$  with  $|T| - |S| \leq N$  we have  $S \leq T$ .

## 3. Basic Definitions and Lemmas

**Definition 3.1.** Suppose  $\phi(x,y)$  is a basic formula. Define X to be the graph on vertices x with edges defined by  $\phi$ . Similarly define Y. Note that X, Y are positive. Additionally, let Y' be a subgraph of Y induced by vertices of Y that are connected to  $W - (X \cup Y)$ , where W is a witness of  $\phi$ .

We will require the following lemmas from [2]:

**Lemma 3.2.** [See 2.3 in [2]] Let  $A, B \subseteq \mathbb{D}$ . Then

$$\dim(A \cup B/A) \le \dim(B/A \cap B).$$

Moreover,

$$\dim(A \cup B/A) = \dim(B/A \cap B) - \alpha E,$$

where E is the number of edges connecting the vertices of  $A \cup B - A$  to the vertices of  $A - A \cap B$ .

**Lemma 3.3.** [See 4.1 in [2]] Suppose A is a positive graph, with at least  $1/\alpha + 2$  vertices. Then for any  $\epsilon > 0$  there exists a graph B such that (A, B) is a minimal pair with dimension  $\leq \epsilon$ . Moreover, every vertex in A is connected to a vertex in B - A.

**Lemma 3.4.** [See 4.4 in [2]] Suppose A is a positive graph, and  $\mathcal{G}$  a model of  $S_{\alpha}$ . Then for any integer S there exists an embedding  $f: A \longrightarrow \mathcal{G}$  such that f(A) is S-strong in  $\mathcal{G}$ .

We conclude this section by stating a couple of technical lemmas that will be useful in our proofs later.

**Lemma 3.5.** Work in an ambient graph  $\mathbb{D}$ . Suppose we have a set B and a minimal pair (A, M) with  $A \subseteq B$  and  $\dim(M/A) = -\epsilon$ . Then either  $M \subseteq B$  or  $\dim(M \cup B/B) < -\epsilon$ .

Proof. By Lemma 3.2

$$\dim(M \cup B/B) \le \dim(M/M \cap B),$$

and as  $A \subseteq M \cap B \subseteq M$ 

$$\dim(M/A) = \dim(M/M \cap B) + \dim(M \cap B/A).$$

In addition we are given  $\dim(M/A) = -\epsilon$ . If  $M \nsubseteq B$  then  $A \subseteq M \cap B \subsetneq M$  and by minimality  $\dim(M \cap B/A) > 0$ . Combining the inequalities above we obtain the desired result:

$$\dim(M \cup B/B) \le \dim(M/M \cap B) = \dim(M/A) - \dim(M \cap B/A) < -\epsilon.$$

**Lemma 3.6.** Work in an ambient graph  $\mathbb{D}$ . Suppose we have a set B and a minimal chain  $\langle M_i \rangle_{0 \leq i \leq n}$  with dimensions

$$\dim(M_{i+1}/M_i) = -\epsilon_i.$$

Let  $\epsilon = \min_{0 \le i \le n} \epsilon_i$ . Then either  $M_n \subseteq B$  or  $\dim((M_n \cup B)/B) < -\epsilon$ .

*Proof.* Let  $\bar{M}_i = M_i \cup B$ . Then:

$$\dim(\bar{M}_n/B) = \dim(\bar{M}_n/\bar{M}_{n-1}) + \dots + \dim(\bar{M}_2/\bar{M}_1) + \dim(\bar{M}_1/B).$$

Either  $M_n \subseteq B$  or at least one of the summands above is nonzero. Apply previous lemma.

**Lemma 3.7.** Suppose we have a minimal pair (A, M) with dimension  $\epsilon$ . Suppose we have some  $B \subseteq M$ . Then  $\dim B/(A \cap B) \ge -\epsilon$ . Moreover if  $B \cup A \ne M$  then  $\dim B/(A \cap B) \ge 0$ .

*Proof.* We have  $\dim(B \cup A/A) \leq \dim B/(A \cap B)$  by Lemma 3.2. As  $A \subseteq B \cup A \subseteq M$  we have  $\dim(B \cup A/A) \geq -\epsilon$  by minimality. Moreover, minimality implies that it is positive if  $B \cup A \neq M$ .

**Lemma 3.8.** Suppose we have a minimal chain  $\langle M_i \rangle_{0 \leq i \leq n}$  with dimensions

$$\dim(M_{i+1}/M_i) = -\epsilon_i.$$

Let  $\epsilon$  be the sum of all  $\epsilon_i$ . Suppose we have a graph B with  $B \subseteq M_n$ . Then  $\dim B/(M_0 \cap B) \ge -\epsilon$ .

*Proof.* Let  $B_i = B \cap M_i$ . We have  $\dim B_{i+1}/B_i \ge \dim M_{i+1}/M_i$  by the previous lemma. Thus

$$\dim B/(M_0 \cap B) = \dim B_n/B_0 = \sum \dim B_{i+1}/B_i \ge -\epsilon.$$

#### 4. Lower bound

In this section we restrict our attention to the following family of basic formulas  $\phi(x,y)$ :

- All formulas have Y' = Y (see Definition 3.1).
- $\bullet$  All formulas define no edges between X and Y.

- Minimal chain of  $\phi(x,y)$  consists of one step, that is we only have one minimal extension as opposed to a chain of minimal extensions.
- The dimension of that minimal extension is smaller than  $\alpha$ .

We obtain a lower bound for the formulas that are boolean combinations of basic formulas written in the disjunctive-conjunctive form. First, define  $\epsilon_L(\phi)$ .

**Definition 4.1.** For a basic formula  $\phi = \phi_{\langle M_i \rangle_{0 \le i \le n}}(x, y)$  let

- $\epsilon_i(\phi) = -\dim(M_i/M_{i-1}).$
- $\epsilon_L(\phi) = \sum_{i=1}^n \epsilon_i(\phi)$ .

**Definition 4.2** (Negation). If  $\phi$  is a basic formula, then define

$$\epsilon_L(\neg \phi) = \epsilon_L(\phi).$$

**Definition 4.3** (Conjunction). Take a collection of formulas  $\phi_i(x, y)$  where each  $\phi_i$  is a positive or a negative basic formula. If both positive and negative formulas are present then  $\epsilon_L(\phi) = \infty$ . We don't have a lower bound for that case. If different formulas define X or Y differently then  $\epsilon_L(\phi) = \infty$ . In the case of conflicting definitions the formula would have no realizations. Otherwise let

$$\epsilon_L \left( \bigwedge \phi_i \right) = \sum \epsilon_L(\phi_i).$$

**Definition 4.4** (Disjunction). Take a collection of formulas  $\psi_i$  where each instance is a conjunction as above all agreing on X and Y. Then

$$\epsilon_L\left(\bigvee\psi_i\right) = \min\epsilon_L(\psi_i).$$

**Theorem 4.5.** For a formula  $\psi$  as above we have

$$\operatorname{vc} \psi \ge \left\lfloor \frac{Y(\psi)}{\epsilon_L(\psi)} \right\rfloor,$$

where  $Y(\psi)$  is  $\dim(Y)$  (as all basic components agree on Y).

*Proof.* First, work with a formula that is a conjunction of positive basic formulas  $\psi = \bigwedge_{i \in I} \phi_i$ . Then as we have defined above

$$\epsilon_L(\psi) = \sum_{i \in I} \epsilon_L(\phi_i).$$

If  $W_i$  is a witness of  $\phi_i$ , let  $S_i = |W_i|$ . Let  $n_1$  be the largest natural number such that

$$n_1 \epsilon_L(\psi) < Y(\psi).$$

Let  $\epsilon'$  be the smallest value among  $\epsilon_L(\phi_i)$ . Suppose it corresponds to the formula  $\phi'$ . Let  $n_2$  be the largest natural number such that

$$n_1 \epsilon_L(\psi) + n_2 \epsilon' < Y(\psi).$$

Fix some  $N > n_1 + n_2$ . Let

$$J = \{0 \le j < N\} \subseteq \mathbb{N}.$$

Let  $a_j$  be a graph isomorphic to X for each  $j \in J$ , pairwise disjoint. Let  $A = \bigcup_{1 \le j \le N} a_j$ . Let

$$S = |Y| + (n_1 + n_2 + 1) \sum_{i \in I} S_i.$$

By Lemma 3.4 the graph A can be embedded into  $\mathbb{G}$  as an S-strong graph. Abusing notation, we identify A with this embedding. Thus we have  $A\subseteq \mathbb{G}$ , S-strong.

Let  $J_1, J_2$  be disjoint subsets of J, of sizes  $n_1, n_2$  respectively. Let b be a graph isomorphic to Y. For each  $i \in I, j \in J_1$  let  $W_{ij}$  be a witness of  $\phi_i(a_j, b)$ . (Note that then  $(a_j \cup b, W_{ij})$  is a minimal pair.) For each  $j \in J_1$  let  $W_j$  be a union of  $\{W_{ij}\}_{i \in I}$  disjoint over  $a_j \cup b$ . For each  $j \in J_2$  let  $W_j$  be a witness of  $\phi'(a_j, b)$ . Let W' be a union of  $\{W_j\}_{j \in J_1 \cup J_2}$  disjoint over b. Let W be a union of W' and A disjoint over  $\{a_j\}_{j \in J_1 \cup J_2}$ .

Claim 4.6. We have  $A \leq W$ .

*Proof.* Consider some  $A \subsetneq B \subseteq W$ . We need to show  $\dim(B/A) > 0$ . Let  $\bar{A} = A \cup b$ . We have

$$\dim(B/A) = \dim(B/B \cap \bar{A}) + \dim(B \cap \bar{A}/A).$$

Let  $B_{ij} = B \cap W_{ij}$ . Let  $B_j = B \cap W_j$ . To unify indices, relabel all the graphs above as  $\{B_k\}_{k \in K}$  for some index set K. By the construction of W we have

$$\dim(B/B \cap \bar{A}) = \sum_{k \in K} \dim(B_k/B_k \cap \bar{A}).$$

Fix k. We have  $B_k \subseteq W_k$ , where  $W_k$  is a minimal extension of  $M_0^k = a \cup b$  for some  $a \in A$ . Let  $\epsilon_k$  be the dimension of this minimal extension. We have  $\dim(B_k/B_k \cap \bar{A}) = \dim(B_k/a \cup (B \cap b))$ .

Case 1:  $B \cap b = b$ . Then  $M_0^k \subseteq B_k \subseteq W_k$  and

$$\dim(B_k/a \cup (B \cap b)) = \dim(B_k/M_0^k).$$

By minimality of  $(M_0^k, B_k)$  we have  $\dim(B_k/M_0^k) \geq -\epsilon_k$ . Thus

$$\dim(B/B \cap \bar{A}) \ge -\sum_{k \in K} \epsilon_k = -\left(n_1 \epsilon_L(\psi) + n_2 \epsilon'\right).$$

In addition

$$\dim(B \cap \bar{A}/A) = \dim(b) = Y(\psi).$$

Combining the two, we get

$$\dim(B/A) > Y(\psi) - (n_1 \epsilon_L(\psi) + n_2 \epsilon'),$$

which is positive by the construction of  $n_1, n_2$  as needed.

Case 2:  $B \cap b \subsetneq b$ .

Claim 4.7. We have  $\dim(B_k/B_k \cap \bar{A}) > 0$ .

*Proof.* Recall that  $\dim(B_k/B_k \cap \bar{A}) = \dim(B_k/a \cup (B \cap b))$ . First, suppose that  $B_k \cup M_0^k \neq W_k$ . Then by Lemma 3.7 we get the required inequality. Thus we may assume that  $B_k \cup M_0^k = W_k$ . By Lemma 3.2 we have

$$\dim(B_k \cup M_0^k/M_0^k) = \dim(B_k/B_k \cap M_0^k) - \alpha E,$$

where E is the number of edges connecting the vertices of  $B_k \cup M_0^k - M_0^k$  to the vertices of  $M_0^k - B_k \cap M_0^k$ . Noting that  $B_k \cup M_0^k = W_k$ ,  $\dim W_k / M_0^k = -\epsilon_k$ , and  $B_k \cap M_0^k = a \cup (B \cap b)$  we may rewrite the equality above as

$$\dim(B_k/a \cup (B \cap b)) = \alpha E - \epsilon,$$

and E is the number of edges connecting the vertices of  $W_k - M_0^k$  to the vertices of  $M_0^k - a \cup (B \cap b)$ . As Y = Y' and  $B \cap b \subseteq b$  we must have  $E \ge 1$ . But then as  $\alpha > \epsilon$  we have  $\dim(B_k/a \cup (B \cap b)) > 0$  as needed.

Now, recall that

$$\dim(B/A) = \dim(B \cap \bar{A}/A) + \sum_{k \in K} \dim(B_k/B_k \cap \bar{A}).$$

By the claim above each of  $\dim(B_k/B_k \cap \bar{A}) > 0$ , thus

$$\dim(B/A) > \dim(B \cap \bar{A}/A).$$

In addition

$$\dim(B \cap \bar{A}/A) = \dim(B \cap b) > 0,$$

as b is postive. Thus  $\dim(B/A) > 0$  as needed.

As  $A \leq W$  and  $A \subseteq \mathbb{G}$ , we can embed W into  $\mathbb{G}$  over A. Abusing notation again, we identify W with its embedding  $A \leq W \subseteq \mathbb{G}$ . In particular, now we have  $b \in \mathbb{G}$ .

Also note that

$$\dim(W/A) = Y(\psi) - (n_1 \epsilon_L(\psi) + n_2 \epsilon'),$$
$$|W| - |A| \le |b| + (n_1 + n_2) \sum_{i \in I} S_i.$$

Lemma 4.8. We have

$$\{a_j\}_{j\in J_1}\subseteq \psi(A,b)\subseteq \{a_j\}_{j\in J_1\cup J_2}.$$

Proof. First inclusion  $\{a_j\}_{j\in J_1}\subseteq \psi(A,b)$  is immediate from the construction of W, as  $W_{ij}$  witnesses that  $\phi_i(a_j,b)$  holds. For the second inclusion, suppose that there is  $a\in A-\{a_j\}_{j\in J_1\cup J_2}$  such that  $\psi(a,b)$  holds. Let  $W'\subseteq \mathbb{G}$  be a witness of  $\phi_1(a,b)$ . First, note that the case  $W'\subseteq W$  is impossible as there are no edges between a and W-a, but there are edges between a and W'-a. Thus assume  $W'\not\subseteq W$ . As  $(a\cup b,W')$  is minimal, by Lemma 3.5 we have  $\dim(W'\cup W/W)<-\epsilon_1$ . Therefore

$$\dim(W' \cup W/A) = \dim(W' \cup W/W) + \dim(W/A) < Y(\psi) - (n_1 \epsilon_L(\psi) + n_2 \epsilon') - \epsilon_1,$$

which is negative by the construction of  $n_1, n_2$ . Thus  $A \not\leq W \cup W'$ , as then it would have a positive dimension. Additionally,

$$|W' \cup W| - |A| \le |W' - W| + |W| - |A| \le S_1 + |b| + (n_1 + n_2) \sum_{i \in I} S_i \le S_i$$

but then this contradicts that A is S-strong, as then we would have  $A \leq W \cup W'$ .  $\square$ 

In the construction of W we have chosen indices  $J_1, J_2$  arbitrarily. In particular, suppose we let  $J_2$  to be the last  $n_2$  indices of J and  $J_1$  an arbitrary  $n_1$ -element subset of the first  $N-n_2$  elements of J. Each of those choices would then yield a different trace  $\psi(A,b)$  by the lemma above. Thus  $\psi(A,M^{|y|}) \geq \binom{N-n_2}{n_1}$  and therefore  $\operatorname{vc}(\psi) \geq n_1$ . By the definition of  $n_1$  we have  $n_1 = \left\lfloor \frac{Y(\psi)}{\epsilon_L(\psi)} \right\rfloor$ , so this proves the theorem for  $\psi$ .

Now consider a formula which is a conjunction consisting of negative basic formulas  $\psi = \bigwedge_{i \in I} \neg \phi_i$ . Let  $\bar{\psi} = \bigwedge_{i \in I} \phi_i$ . Do the construction above for  $\bar{\psi}$  and

suppose its trace is  $X \subseteq A$  for some b. Then over b the same construction gives trace (A - X) for  $\psi$ . Thus we get as many traces as above, and the same bound.

Finally consider a formula which is a disjunction of formulas considered above  $\theta = \bigvee_{k \in K} \psi_k$ . Choose the one with the smallest  $\epsilon_L$ , say  $\psi_k$ , and repeat the construction above for  $\psi_k$ . Any trace we obtain is automatically a trace for  $\theta$ , and thus we get as many traces as above, and the same bound.

**Corollary 4.9.** VC-function is infinite in Shelah-Spencer random graphs:

$$vc(n) = \infty$$
.

Proof. Let A be a graph consisting of  $1/\alpha + 2 + n$  disconnected vertices. Fix  $\epsilon > 0$ . By Lemma 3.3, there exists B such that (A,B) is minimal with dimension  $\leq \epsilon$ . Consider a basic formula  $\psi_{A,B}(x,y)$  where  $|x| = 1/\alpha + 2$  and |y| = n. Then by the theorem above  $\operatorname{vc}(n) \geq \operatorname{vc}(\psi_{A,B}) \geq \frac{n}{\epsilon}$ . As  $\epsilon$  was arbitrary, this number can be made arbitrarily large, giving  $\operatorname{vc}(n) = \infty$  as needed.

#### 5. Upper bound

We bound the number of types of some finite collection of formulas  $\Psi(\vec{x}, \vec{y}) = \{\phi_i(\vec{x}, \vec{y})\}_{i \in I}$  over a parameter set B of size N, where  $\phi_i$  is a basic formula.

Fix a formula  $\phi$  from our collection. Suppose it defines a minimal chain extension over  $\{x,y\}$ . Record the size of that extension as  $K(\phi)$  and its total dimension  $\epsilon(\phi) = \epsilon_U(\phi)$ . Define dimension of that formula  $D(\phi) = |\vec{y}| \frac{K(\phi)}{\epsilon(\phi)}$  Define dimension of the entire collection as  $D(\Psi) = \max_{i \in I} D(\phi_i)$ 

In general we have parameter set  $B \subseteq \mathbb{G}^{|y|}$ , however without loss of generality we may work with a parameter set  $B^{|y|}$ , with  $B \subseteq \mathbb{G}$ .

Let 
$$S = \lfloor D(\Psi) \rfloor$$
.

For our proof to work we also need B to be S-strong. We can achieve this by taking (the unique) S-strong closure of B. If size of B is N then the size of its closure is O(N). So without loss of generality we can assume that B is S-strong.

**Definition 5.1.** A <u>witness</u> of a is a union of realizations of the existential formulas  $\phi_i(a,b)$  for all i,b so that the formula holds.

**Definition 5.2.** For sets C, B define the boundary of C over B

$$\partial(C,B) = \{b \in B \mid \text{there is an edge between } b \text{ and element of } C - B\}$$

**Definition 5.3.** For each a pick some  $\bar{M}_a$  to be its witness. Define two quantities

- $\partial_a$  is the boundary  $\partial(\bar{M}_a, B \cup a)$
- Suppose  $G_1, G_2$  are some subgraphs of our model and  $a_1 \subseteq G_1, a_2 \subseteq G_2$  finite tuples of vertices. Call  $f: (G_1, a_1) \longrightarrow (G_2, a_2)$  a  $\partial$ -isomorphism if it is a graph isomorphism, f and  $f^{-1}$  are constant on B, and  $f(a_1) = a_2$ .
- Define  $\mathscr{I}_a$  as the  $\partial$ -isomorphism class of  $(\bar{M}_a, a)$ .

**Lemma 5.4.** If  $\mathscr{I}_{a_1} = \mathscr{I}_{a_2}$  then  $a_1, a_2$  have the same  $\Psi$ -type over B.

*Proof.* Fix a  $\partial$ -isomorphism  $f: (\bar{M}_{a_1}, a_1) \longrightarrow (\bar{M}_{a_1}, a_2)$ . Suppose we have  $\phi(a_1, b)$  for some  $b \in B$ . Pick witness of this existential formula  $M_1 \subseteq \bar{M}_{a_1}$ . Then  $f(M_1)$  is a witness for  $\phi(a_2, b)$ .

Thus to bound the number of traces it is sufficient to bound the number of possibilities for  $\mathscr{I}_a$ .

## Theorem 5.5.

$$|\partial_a| \leq D(\Psi)$$

$$|\bar{M}_b - \bar{A}| \le D(\Psi)$$

# Corollary 5.6.

$$\operatorname{vc}(\phi) \le K(\phi) \frac{Y(\phi)}{\epsilon(\phi)}$$

*Proof.* We count possible  $\partial$ -isomorphism classes  $\mathscr{I}_b$ . Let  $W = K(\phi) \frac{Y(\phi)}{\epsilon(\phi)}$ . If the parameter set A is of size N then there are  $\binom{N}{W}$  choices for boundary  $\partial_b$ . On top

of the boundary there are at most W extra vertices and  $(2W)^2$  extra edges. Thus there are at most

$$W \cdot 2^{(2W)^2}$$

configurations up to a graph isomorphism. In total this gives us

$$\binom{N}{W} \cdot W \cdot 2^{(2W)^2} = O(N^W)$$

options for  $\partial$ -isomorphism classes. By Lemma 5.4 there are at most  $O(N^W)$  many traces, giving the required bound.

Proof. (of Theorem 5.5) Fix some b-trace  $A_b$ . Enumerate  $A_b = \{a_1, \dots, a_I\}$ . Let  $M_i/\{a_i, b\}$  be a witness of  $\phi(a_i, b)$  for each  $i \leq I$ . Let  $\bar{M}_i = \bigcup_{j < i} M_j$ . Let  $\bar{M} = \bigcup M_i$ , a witness of  $A_b$ 

# Claim 5.7.

$$\left| \partial (M_i M, \bar{A}) - \partial (M, \bar{A}) \right| \le |M_i| = K(\phi)$$
$$\dim(M_i M \bar{A}/M \bar{A}) > -\epsilon(\phi)$$

**Definition 5.8.** (j-1,j) is called a jump if some of the following conditions happen

• New vertices are added outside of  $\bar{A}$  i.e.

$$\bar{M}_j - \bar{A} \neq \bar{M}_{j-1} - \bar{A}$$

• New vertices are added to the boundary, i.e.

$$\partial(\bar{M}_i, \bar{A}) \neq \partial(\bar{M}_{i-1}, \bar{A})$$

**Definition 5.9.** We now let  $m_i$  count all jumps below i

$$m_i = |\{j < i \mid (j - 1, j) \text{ is a jump}\}|$$

### Lemma 5.10.

$$\dim(\bar{M}_i/\bar{A}) \le -m_i \cdot \epsilon(\phi)$$
$$|\partial(\bar{M}_i, \bar{A})| \le m_i \cdot K(\phi)$$
$$|\bar{M}_i - \bar{A}| \le m_i \cdot K(\phi)$$

*Proof.* (of Lemma 5.10) Proceed by induction. Second and third propositions are clear. For the first proposition base case is clear.

Induction step. Suppose  $\bar{M}_j \cap (A \cup b) = \bar{M}_{j+1}$  and  $\partial(\bar{M}_j, A) = \partial(\bar{M}_{j+1}, A)$ . Then  $m_i = m_{i+1}$  and the quantities don't change. Thus assume at least one of these equalities fails.

Apply Lemma 3.6 to  $\bar{M}_j \cup (A \cup b)$  and  $(M_{j+1}, a_{j+1}b)$ . There are two options

- $\dim(\bar{M}_{i+1} \cup (A \cup b)/\bar{M}_i \cup (A \cup b)) \leq -\epsilon_U$ . This implies the proposition.
- $M_{j+1} \subseteq \bar{M}_j \cup (A \cup b)$ . Then by our assumption it has to be  $\partial(\bar{M}_j, A) \neq \partial(\bar{M}_{j+1}, A)$ . There are edges between  $M_{j+1} \cap (\partial(\bar{M}_{j+1}, A) \partial(\bar{M}_j, A))$  so they contribute some negative dimension  $\leq \epsilon_U$ .

This ends the proof for Lemma 5.10.

(Proof of Theorem 5.5 continued) First part of lemma 5.10 implies that we have  $\dim(\bar{M}/\bar{A}) \leq -m_I \cdot \epsilon(\phi)$ . The requirement of A to be S-strong forces

$$m_I \cdot \epsilon(\phi) < Y(\phi)$$

$$m_I < \frac{Y(\phi)}{\epsilon(\phi)}$$

Applying the rest of 5.10 gives us

$$|\partial(\bar{M}, A)| \le m_I \cdot K(\phi) \le \frac{K(\phi)Y(\phi)}{\epsilon(\phi)}$$
$$|\bar{M} \cap A| \le m_I \cdot K(\phi) \le \frac{K(\phi)Y(\phi)}{\epsilon(\phi)}$$

as needed. This ends the proof for Theorem 5.5.

So far we have computed an upper bound for a single basic formula  $\phi$ .

To bound an arbitrary formula, write it as a boolean combination of basic formulas  $\phi_i$  (via quantifier elimination) It suffices to bound vc-density for collection of formulas  $\{\phi_i\}$  to obtain a bound for the original formula.

In general work with a collection of basic formulas  $\{\phi_i\}_{i\in I}$ . The proof generalizes in a straightforward manner. Instead of  $A^{|x|}$  we now work with  $A^{|x|} \times I$  separating traces of different formulas. Formula with the largest quantity  $Y(\phi)\frac{K(\phi)}{\epsilon(\phi)}$  contributes the most to the vc-density. Thus we have

$$\Phi = \{\phi_i\}_{i \in I}$$
$$vc(\Phi) \le \max_{i \in I} Y(\phi_i) \frac{K(\phi_i)}{\epsilon_{\phi_i}}$$
