I am interested in a postdoctoral position at Princeton University because there are many faculty with whom I share research interests. Ideas about modularity and the Langlands Program influenced my thesis, so I am interested in working with Richard Taylor at the IAS. I am also interested in Skinner and Bhargava's recent work on the BSD Conjecture, particularly the p-adic aspects of their work. If given a position at Princeton, I wold be an active participant in the number theory learning seminars as well as the Princeton/IAS Number Theory Seminar.
